Black Friday checkout checklist: 7 fixes before 27 November

November is peak sale season in the US, the UK and Australia, with Black Friday, Cyber Monday and Click Frenzy. Sale traffic is the most expensive traffic you will buy all year. These fixes need no redesign and can ship before the sale.

> Baymard Institute estimates the average large ecommerce site can gain 35% higher conversion through better checkout design alone.

The 7 fixes

- [ ] Show shipping cost or the free-shipping threshold on the product page and in the cart
- [ ] Turn on guest checkout
- [ ] Turn on express payment: Shop Pay, Apple Pay and Google Pay, plus a buy-now-pay-later option if its fee still leaves margin
- [ ] Show a delivery date that accounts for sale-week carrier delays
- [ ] Make stock and offer messaging honest and clear: what is discounted and until when
- [ ] Run a mobile speed test and remove any app added since the last one
- [ ] Add a post-purchase upsell that keeps margin: a complementary product, not a deeper discount

Timeline

- [ ] Three weeks out: speed test, app clean-up, checkout settings
- [ ] Two weeks out: offer pages live in draft, delivery cut-off dates set
- [ ] Week of the sale: freeze theme changes; watch checkout conversion daily
- [ ] After the sale: send the delivered and how-to-use email, then a review request

Protect margin

- [ ] Check each offer against contribution per order, not just revenue
- [ ] Avoid stacking site-wide discounts with discount codes
